

Batwing Lens

With the Batwing lens, PROLICHT offers an innovative solution for indirect lighting in rooms with low ceilings. This specially designed lens provides a wide beam light distribution for uniform and efficient illumination.

The Batwing lens uses precise optics to direct the light and create a homogeneous illumination. This makes it an ideal choice for office, hospitality, retail, education, healthcare and many other architectural environments where high quality indirect lighting is required.

The Batwing lens can currently be integrated into the SLIDER and HYPRO product ranges and is designed for use in future profile systems. This will enable architects and lighting designers to achieve efficient and high quality indirect lighting even in rooms with low ceilings.
